Email

Malicious Code (Virus) Screening
In addition to the Enron requirement for email attachments (received and sent) to be screened for malicious code (viruses, Trojan Horses, etc.), users of Enron information resources are required to detach email attachments that are received on to their hard drive for local virus screening purposes.

All executables (*.bat, *exe, *.com) files should never be launched from email without first consulting with IT.

Virus Alerts
The Internet is constantly being flooded with information about computer viruses and Trojan Horses. However, within among real virus notices are computer virus hoaxes. While these hoaxes do not infect systems, they are still time consuming and costly to handle. It only wastes bandwidth and un-necessarily alarms other computer users.

Please, do not perpetuate unconfirmed warnings about viruses and Trojan Horses. If you receive an un-validated warning, don't pass it to all your friends, pass it to your IT computer security manager to validate first.
